### Abstract

The article deals with the study of the general Yakut speaking base – articulation as a model. It forms the orthoepical potential of the Yakut language. Patterns of interaction of language and intonational structures of a separate word, word-combination and communicational types of phrases are defined. Criteria of speaking behavior are also defined, on the basis of which indicators of correctness of perceived acoustic parameters of articulated speech signals are revealed. This whole complex of articulatory-acoustic speech indicators allows to consider speech signal as not only physiological formation, but also as indispensable designer of cogitative sides of speaking act. Therefore, in standard peculiarities of Yakut speaking, specific parameters are formed, due to which judgmental potential of speech model is typologically formed. Logically-grammar peculiarity of speaking act as semantically important object forms standard feature of idea. Consequently, discussed acoustic parameters of existing Yakut speaking establish defining their communicational formula of types of utterances.
